It is shown that individuals accept new technologies more easily, if the technology replicates their individual social values and if the implementation process considers the prime social values that can typically be found in their social networks.

Humans are complex social beings. To understand human behaviour, an integrated perspective is required - one which considers both what we regularly do (our personality traits) and what motivates us (our values). Personality, Values, Culture uses an evolutionary perspective to look at the similarities and differences in personality and values across modern societies. Integrating research on personality and human values into a functional framework that highlights their underlying compatibilities (driven by shared genetic and brain mechanisms), Fischer describes how personality is shaped by the complex interplay between genes and the environment, both over the course of human evolution and within the lifespan of individuals. He proposes a gene-culture coevolution model of personality and values to explain how and why people differ around the world and how genes, economics, social conditions, and climate jointly

shape personality.

Outline of Theoretical Psychology discusses basic philosophical problems in the discipline and profession of psychology. The author addresses such topics as what it means to be human in psychology; how psychological knowledge is possible and what it consists of; the role of social justice in psychology; and how aesthetic experience could help us to understand the human condition. Proposing possible solutions to a range of such issues, Thomas Teo situates theoretical questions within traditional branches of philosophical inquiry: ontology, epistemology, ethics, and aesthetics. This book argues that in order to improve psychology as a discipline and in practice, psychologists must reconceive the unit of psychological analysis, looking beyond individual capacity and even experience. By engaging with these basic philosophical problems, Teo demonstrates how psychology can avoid its common pitfalls and continue as a force for resistance and the good.

The principal barrier to the introduction of more sustainable disposal methods has previously been thought to be the lack of both available knowledge and an awareness of the benefits and ease of these systems. Illustrated by an in-depth analysis of waste reduction, reuse and recycling behaviour in Exeter, Devon, this volume questions these assumptions. It not only provides a fresh examination of the previous (mainly US-focused) research into the underlying determinants of waste management behaviour from a geographical perspective, but also develops a new theoretical model based on the Theory of Reasoned Action. Linking three broad categories: environmental values, situational characteristics and psychological factors, the book provides a timely evaluation of research on household waste management, develops an original analytical model and demonstrates the utility and importance of focusing on individual attitudes.

This book is a critical study of the work of legal psychologists, particularly in the United States, and the assumptions upon which the work is based. It rejects an experimentalist model of legal psychology and claims that the use of such a model is not scientific and therefore superior to other ways of analysing the legal system. It proposes ultimately an approach based upon the interpretive nature of human social experience and its effects upon behavior.

A leading economist discusses the potential of happiness research (the quantification of well-being) to answer important questions that standard economics methods are unable to analyze. Revolutionary developments in economics are rare. The conservative bias of the field and its enshrined knowledge make it difficult to introduce new ideas not in line with received theory. Happiness research, however, has the potential to change economics substantially in the future. Its findings, which are gradually being taken into account in standard economics, can be considered revolutionary in three respects: the measurement of experienced utility using psychologists' tools for measuring subjective well-being; new insights into how human beings value goods and services and social conditions that include consideration of such non-material values as autonomy and social relations; and policy consequences of these new insights that suggest different ways for government to affect individual well-being. In *Happiness*, emphasizing empirical evidence rather than theoretical conjectures, Bruno Frey substantiates these three revolutionary claims for happiness research. After tracing the major developments of happiness research in economics and demonstrating that we have gained important new insights into how income, unemployment, inflation, and income demonstration affect well-being, Frey examines such wide-ranging topics as democracy and federalism, self-employment and volunteer work, marriage, terrorism, and watching television from the new perspective of happiness research. Turning to policy implications, Frey describes how government can provide the conditions for people to achieve well-being, arguing that a crucial role is played by adequate political institutions and decentralized decision making. *Happiness* demonstrates the achievements of the economic happiness revolution and points the way to future research.

This book paints a comprehensive picture of well-being in OECD countries and other major economies, by looking at people's material living conditions and quality of life across the population.

This collection of original papers shows how women in Britain are still being discriminated against during schooling, despite the existence of legislation prohibiting

such discrimination and despite apparent concern with promoting equality between the sexes in education. Focusing on the current situation and experiences of women in education and their subsequent entry to, and experiences of, the labour market, the book shows how the category of gender is made relevant in the education of women: how it is influential in structuring their actions, beliefs, values and life chances, and how it provides them with a set of contradictions about their role in society.

Cross-Cultural Psychology: Why Culture Matters addresses both established and very recent research in cultural and comparative cross-cultural psychology. The book is written by Professor Krum Krumov of Sofia University in Bulgaria and Professor Knud S. Larsen from Oregon State University. The authors are long-term colleagues with extensive research experience in cultural, cross-cultural and international settings. The book starts with a discussion of the tentative nature of cultural information given the forces of globalization and communication integration. Weighing these issues still permits for some powerful conclusions about differences that matter as well as human universals based on our communalities. The reader is also provided with a through

grounding in relevant research approaches and critical thinking that provides the basis for an evaluation of the research literature. Further, the book reports on what we know about the origin of culture, especially the forces of cultural transmission and the evidence for socio-cultural evolution. The impact of culture and psychology on human development is contrasted and evaluated. A chapter on language stresses the importance of evolutionary forces and the relationship to socio-culture. In turn that discussion sets the stage for reporting the relevant research on cognition that yields information on the impact of genetics, but also the affect of cultural evolution. A distinct contribution is the evaluation of human happiness and emotions. The book demonstrates tangible relationships to both the universal expressions of emotions, but also the impact of cultural values on well-being. A consideration of personality theory follows in the systematic and progressive discourse in the book. Research is reported on Western, Eastern and Indigenous conceptualizations and research approaches. The discussion on the self is considered next and the authors evaluate cultural, social and comparative cross-cultural dimensions. Finally, a discussion of sex and gender follows as associated with salient cross-cultural dimensions. The book concludes with a discussion of the affect of cultural values in organizational behavior and a consideration of the relationship between culture and human health.

This book explores foreign policy developments in post-colonial Africa. A continental foreign policy is a tenuous proposition, yet new African states emerged out of armed resistance and advocacy from regional allies such as the Bandung Conference and the League of Arab States. Ghana was the first Sub-Saharan African country to gain independence in 1957. Fourteen more countries gained independence in 1960 alone, and by May 1963, when the Organisation of African Unity (OAU) was formed, 30 countries were independent. An early OAU committee was the African Liberation Committee (ALC), tasked to work in the Frontline States (FLS) to support independence

in Southern Africa. Pan-Africanists, in alliance with Brazzaville, Casablanca and Monrovia groups, approached continental unity differently, and regionalism continued to be a major feature. Africa's challenges were often magnified by the capitalist-democratic versus communist-socialist bloc rivalry, but through Africa's use and leveraging of IGOs – the UN, UNDP, UNECA, GATT, NIEO and others – to advance development, the formation of the African Economic Community, OAU's evolution into the AU and other alliances belied collective actions, even as Africa implemented decisions that required cooperation: *uti possidetis* (maintaining colonial borders), containing secession, intra- and inter-state conflicts, rebellions and building RECs and a united Africa as envisioned by Pan Africanists worked better collectively.
