The classic view of cerebrovascular physiology has been that blood flow and cerebral metabolism are tightly coupled under the influence of substances, such as H<sup>+</sup>, adenosine, nitric oxide, and K<sup>+</sup>, which ensure a rapid and matched supply of blood. In part driven by the use of cerebral blood flow measurements in functional brain imaging, it has become clear that astrocytes also play a role in modulating functionally associated changes in cerebral blood flow. The concept of neural control or neurogenically mediated changes in cerebral blood flow is relatively newer, although the presence of such nerves was probably identified anatomically more than 500 years ago. The autonomic innervation of the cranial circulation has both a sympathetic component that arises predominantly from the superior cervical ganglion and a cranial parasympathetic component that traverses the pterygopalatine (sphenopalatine) and otic ganglion. Neuropeptide transmitters such as neuropeptide Y (NPY), vasoactive intestinal polypeptide (VIP), and pituitary adenylate cyclase-activating peptide (PACAP), helodermin, and helospectin have each been identified in components of the system. Clinical problems such as migraine, cluster headache, and stroke likely involve the autonomic innervation of the cerebral circulation in terms of disorder expression and ultimately with an eye to novel therapies.

A comprehensive, cutting-edge review of the complex interactions between maternal and fetal-placental tissues that control the establishment and maintenance of pregnancy, the proper development of the fetus, the birth process, and the behavioral aspects of bonding between mother and newborn. Expert researchers review the endocrine and physiological events that culminate in the delivery of offspring, and provide a solid base of comparative information on the menstrual cycle of primates, including humans. They also discuss the sources and functions of both steroid and protein hormones from the placenta and the details of their effects on uterine function, placental development, fetal growth and well-being, and maternal responses to pregnancy. This book will become the standard reference source not only for reproductive scientists, but also for those clinicians who want better to understand the complex factors that affect pregnancy-and their pregnant patients.

Health assessment is an ongoing process that evaluates the whole person as a physical, psychosocial and functional being, whether they are young or old, well or ill. This market-leading text presents health assessment, physical examination information and skills for health professionals who undertake these types of assessments. Health Assessment and Physical Examination is scaffolded from foundation to more advanced health assessment, following a body-systems approach and a 'head-to-toe' approach. It uses the ENAP (Examine–Normal–Abnormal–Pathophysiology) approach as a tool for students to collect useful information. An applied case study at the end of each chapter walks students through an example of an assessment. This comprehensive yet student-friendly text is noted for its high-quality case studies, pedagogical elements, and excellent student resources. Unique to this text are the advanced topics and 'Urgent findings', which highlights serious or life-threatening signs or critical assessment findings that need immediate attention.

Hormones provides a comprehensive treatment of human hormones viewed in the light of modern theories of hormone action and in the context of current understanding of subcellular and cellular architecture and classical organ physiology. The book begins with discussions of the first principles of hormone action and the seven classes of steroid hormones and their chemistry, biosynthesis, and metabolism. These are followed by separate chapters that address either a classical endocrine system, e.g., hypothalamic hormones, posterior pituitary

hormones, anterior pituitary hormones, thyroid hormones, pancreatic hormones, gastrointestinal hormones, calcium regulating hormones, adrenal corticoids, hormones of the adrenal medulla, androgens, estrogens and progestins, and pregnancy and lactation hormones; or newer domains of hormone action which are essential to a comprehensive understanding of hormone action, including prostaglandins, thymus hormones, and pineal hormones. The book concludes with a presentation of hormones of the future, i.e., cell growth factors. This book is intended for use by first-year medical students, graduate students, and advanced undergraduates in the biological sciences. It is also hoped that this book will fill the void that exists for resource materials for teaching cellular and molecular endocrinology and that it will be employed as an equal partner with most standard biochemistry textbooks to provide a comprehensive and balanced coverage of this realm of biology. The neurology of sex and bladder disorders requires specialized knowledge and represents a challenge for clinical neurologists focused on the neurological condition. Sex and bladder disorders are often related to more general neurological disorders like Parkinson's disease and multiple sclerosis, and often the sex and bladder disorders are passed to specialists in urology. **Neurology of Sexual and Bladder Disorders: Handbook of Clinical Neurology** is a focused, yet comprehensive overview that provides complete tutorial reference to the science, diagnosis and treatment of sex and bladder disorders from a neurologic perspective. Comprehensive coverage of the neurology of sex and bladder disorders Details the latest techniques for the study, diagnosis and treatment of sex and bladder dysfunction from a neurological perspective A focused reference for clinical practitioners and neurology research communities

Anatomy and Histology of the Laboratory Rat in Toxicology and Biomedical Research presents the detailed systematic anatomy of the rat, with a focus on toxicological needs.
