A complete blood count (CBC) or full blood count (FBC) is a common blood test that evaluates the three major types of cells in the blood – red blood cells, white blood cells and platelets. It is used to detect or monitor many different health conditions including diagnosing infections or allergies, detecting blood clotting problems or blood disorders, including anemia, and evaluating red blood cell production or destruction. This book is a practical guide for students and trainee pathologists to help with interpretation of CBC to ensure accurate diagnosis and treatment of correlating diseases and disorders.

Beginning with an introduction to CBC, the following sections describe different measurements and parameters for each of the three types of blood cells. The book includes 30 clinical case studies and numerous full colour images and illustrations. The final chapter discusses quality control. teachers of morphological hematology and for technologists who are responsible for the examination of smears by manual or automated methods. A knowledge of morphology is also useful for residents in clinical and anatomic pathology, pediatrics, and medicine. Major emphasis is placed on the anatomical characteristics of individual cells in the various stages of their maturation as revealed by light microscopy, employing an oil-immersion objective. Unless otherwise stated, the cells that are described and visually pictured by the artist, Dorothy Sturm, are those present in thin, air-exposed, dried smears or marrow imprints that have been stained by Wright stain.

This easy to use resource prepares clinical laboratory scientists and clinical laboratory technicians for the certification and re-certification examinations. The back of the book features two review tests for practice, for CLT and for CLS. An accompanying CD-ROM contains 500 practice questions.

The development of a sociology of medical knowledge is both assessed and contributed to in *Medical Talk and Medical Work*. Underlying the analysis is research on the work of haematologists, which offers a rich resource for understanding the complexities and contradictions between physical bodies and social embodiment, medical talk and technical apparatus. Using but moving

beyond this specific material, Paul Atkinson demonstrates the strengths and weaknesses of the existing understanding of medical knowledge. Among the issues explored are: the place of interaction among doctors, rather than between doctors and patients, in defining the construction of medical knowledge; the ways in which clinical opinion is socially produced and the nature of the local settings through which this process occurs; and the relations among medical knowledge, medical language and the increasingly technological contexts of contemporary medical practice.
