Critical Care of Children with Heart Disease will summarize the comprehensive medical and surgical management of the acutely-ill patient with congenital and acquired cardiac disease. The aim of the book is to teach bedside physicians, nurses and other caregivers, basic and practical concepts of anatomy, pathophysiology, surgical techniques and peri-operative management of critically ill children and adults with congenital heart disease, allowing these professionals to anticipate, prevent or else treat such pathologies. The book will cover specific cardiac lesions, review their anatomy, pathophysiology, current preoperative, intraoperative and postoperative assessment and management; medical and surgical complications will be briefly described with each lesion further discussed in specific chapters. In addition, the book will have dedicated chapters to management of cardiac patients on extracorporeal membrane oxygenation, hemofiltration, hemo or peritoneal dialysis and plasma exchange. Practical guidelines for cardiovascular nursing care will be also included.

This important revision presents the accumulated knowledge of its highly-regarded author, Dr. Abraham Rudolph, who is internationally recognized as one of the world's leading pioneers in the field of Pediatric Cardiology. Fully revised and updated, the book includes sections considering the changes in pathophysiology with growth into adulthood and the effects of various treatment approaches. The author explains the physiology of normal fetal circulation and the effects of congenital cardiac lesions, with particular reference to the interactions between the lesions and fetal cardiovascular development.

This book combines an exceptional wealth of precise, exquisite schematic drawings and high-quality images with clear explanatory text in order to provide readers with a crisp and clear understanding of all aspects of congenital heart disease, from diagnosis to treatment and from the fetus to the adult. In format the book appears similar to a large collection of case reports covering all types of congenital heart disease, including complex lesions such as single ventricle and atrial isomerism. For each lesion, the illustrations are placed before the text so that the reader can gain a quick and general overview before going into more detail. The contents are as practical and concise as possible. The intention is that, despite its size, the book will serve as a handy reference for cardiologists, surgeons, intensivists, obstetricians specializing in fetal sonography, nurses, trainees, students, researchers, and even patients and their families. This is a "must-have" bedside reference in the cardiac ward, the ICU, and the fetal sonography room and will even be valuable in outpatient clinics.

This book comprehensively covers a range of pathological cases in clinical cardiology. Chapters are case focused and detail how a patient is diagnosed and treated in a step-by-step format. A range of engaging video clips enhances the readers appreciation and understanding of how to apply these techniques into their day-to-day clinical practice with special focus on congenital heart disease diagnosis and management. Case-Based Clinical Cardiology presents a range of clinical scenarios across all cardiology disciplines with a particular focus on echocardiography, electrocardiography and cardiac catheterization. Therefore, it is an ideal resource for both the novice and experienced cardiology practitioner seeking an up-to-date selection of cases to test their knowledge.
