Excerpt from The Navigator's Pocket-Book: Arranged for Immediate Reference to Any Navigation Subject; A Complete Guide and Instructor for the Navigator, Containing Four Hundred Adequate Definitions in Addition to All the Practical Rules for Working Middle Latitude There are many voluminous and bewildering works on the subject of navigation, but up to the present time there has not existed a series of short, simple laws founded on correct principles and expressed in homely language, whereby the navigator might quickly develop his position under various conditions at sea and along shore. In this little volume has been incorporated every practical formula for determining the latitude and longitude by dead reckoning and by solar, lunar, and stellar observations, as well as concise and lucid directions for chart work, the various sailings, and for accurately fixing the ship's place when in sight of land, and in every consideration the author has succeeded in simplifying and abridging the confusing and tedious rules and methods in common use. The purely original arrangement of this pocket edition of commonsense navigation contributes generously to its value, as it affords means of immediate recourse to any and every subject within the sphere of the practical navigator. The problems are all worked according to Bowditch's American Nautical Tables, which may be purchased from any book-dealer for but it is to be explained that the numbers called for in the text may be verified in the preface. Excerpt from A Guide to Practical Navigation: Containing the Rules and Methods of Solving Problems in the Most Practical Manner; The Simplest and Most Complete Method for Finding a Ship's Position at Sea For finding latitude by stellar altitudes (which circumstances not infrequently render desirable at sea) I have referred to the American Ephemeris for the declination of the fixed stars instead of to the English tables; and have also followed the star-notation of the former. I have used a portion of the latter only in the problems for exercise in this work. I would call the student's special attention to the system of finding simultaneously latitude and longitude by double altitude; a system not to be found in any American work that I have seen, and one upon which too much stress can scarcely be laid. This book is for anyone who owns, or is thinking of owning, a Vixen Star Book Ten telescope mount or its predecessor. A revolution in amateur astronomy has occurred in the past decade with the wide availability of high tech, computer-driven, Go-To telescopes. Vixen Optics is leading the way by offering the Star Book Ten system, with its unique star map graphics software. The Star Book Ten is the latest version of computer telescope control using star map graphics as a user interface, first introduced in the original Star Book first offered in 2003. The increasingly complicated nature of this software means that learning to optimize this program is not straightforward, and yet the resulting views when all features are correctly deployed can be phenomenal. After a short history of computerized Go-To telescopes for the consumer amateur astronomer market, Chen offers a treasury of technical information. His advice, tips, and solutions aid the user in getting the most out of the Star Book Ten system in observing sessions.

The International Air Guide was published in 1931, and it contains all international airports, aerodromes and airfields. Any large airport, but also any little-known airfield, is described in detail. In most cases, this description also includes a historical aeronautical chart and aerodrome map with reference to the corresponding coordinates, radio frequencies and special geographical blockades. For those who are interested in aeronautics and in aviation history, and for those, who want to locate vanished or abandoned airfields, the International Airport Guide is a perfect tool.

Excerpt from Pugsley's New Guide to the United States Local Inspectors Examination of Masters and Mates of Ocean-Going Steam and Sailing Ships: Containing All Useful Information and Explaining How to Find Latitude and Longitude by Observation, and Many Other Useful Calculations Not Included in the Examination This work is not only a complete guide to the United States Local Inspectors Examination of Masters and Mates, a treatise on 'navigation, nautical astronomy and law of storms, but a valuable text-book for the student and a handy work for the navigator to use as a reference. At present, no other work is published which contains an exact list of questions given by the Examiners. In the preparation of this work no effort has been spared in making the problems as plain and simple as possible, and the methods used are the most reliable, and can be performed with any epitome of navigation; but for convenience, only that of Bowditch and no other has been used in working out the various examples.
